

The new generation pad for maintenance cleaning

The new PU pad is an innovative further development of the conventional cleaning pad. A polyether and polyester material composition makes this pad especially robust and resistant to breakage. Its high density per m³ means it lasts up to 10 times longer and, consequently, is considerably more efficient than a conventional melamine pad. Very high surface results of up to 50,000 m² can be achieved with the PU pad. Applications are extremely varied, as it can be used on all hard floors.

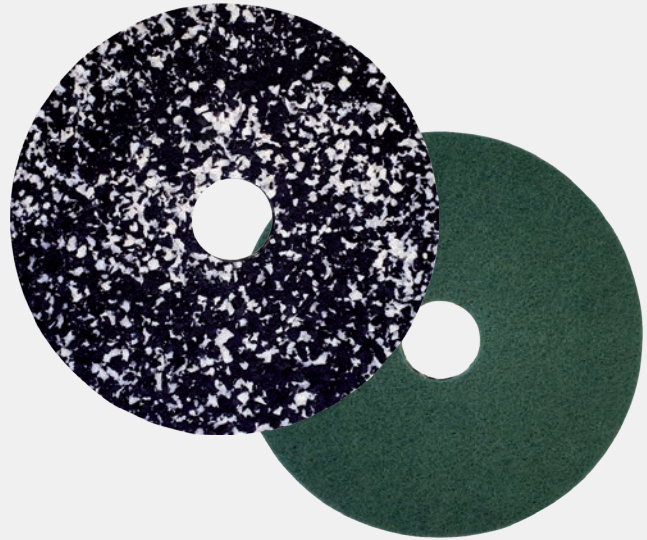

For basic and maintenance cleaning of all hard flooring surfaces, ranging from tiles, stone floors, fine stoneware and concrete floors to vinyl flooring, PVC and linoleum. Particularly suitable for use in public institutions, airports, shopping centres, hotels, restaurants and office buildings.

The reverse side (green) of the pad can be used for stubborn soiling.

Properties

- » Absorbs considerably more water
- » Can be used for all water-resistant hard flooring materials
- » Suitable for all cleaning machines up to 400 rpm (reduced service life with OES 430).
- » Both sides can be used (pad face and green pad reverse side)
- » 100% eco-friendly, thanks to the exclusive use of recycled products
